THE WEBSITE, SEAT BY SEAT

# The site administrator

Runs the platform itself. Passes every permission check, everywhere. Written for a developer joining the project.

| WHO | SCREENS | CAPTURED |
| --- | --- | --- |
| Site administrator | 18 | 10/15/2026 |

**Every screenshot shows simulated, seeded data**, captured in dark mode while signed in as this user type. Nothing here is a real person, case or investigation. Where a page shows a refusal, that is the designed behavior for this seat.

The SuperAdmin operates the site rather than using it: people, groups, taxonomies, billing, moderation, and the diagnostics that say whether the platform is healthy.

Two of these screens exist because something went wrong and could not be seen. **Outgoing Mail** exists because a real sign-up produced no email and nothing anywhere recorded it — a failure that is invisible from every other surface, since the account exists and the site is up. **Rate limits** and the **audit log** are the same idea: the platform explaining itself rather than requiring somebody to read the database.

## How this site decides what you may see

Two things gate every surface, and they are different questions:

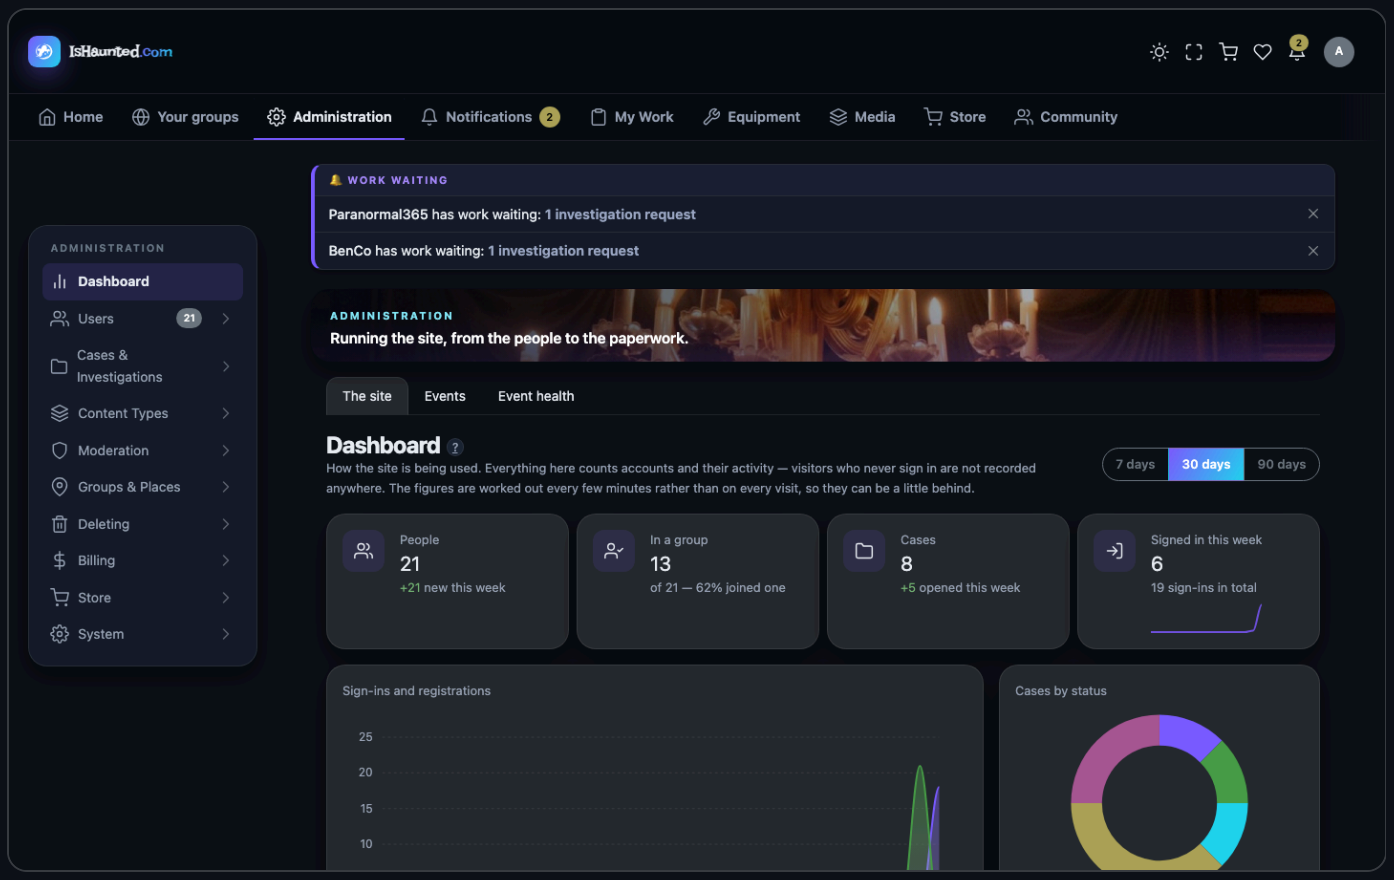

**Your seat in a group** — owner, administrator, member, viewer — answers "may this person do this?". **The group's plan** answers "does this group pay for this at all?". A member of a group whose plan excludes an area is refused for a completely different reason than a viewer who is not allowed to write, and the site says which.

> **A refusal is never rendered as "nothing here."** An empty list and a server saying no are different facts, and a page that shows the same gray nothing for both teaches people to distrust it. Every list goes through `LoadResult`, which carries loading, empty, refused, session-ended and rate-limited as distinct states — and every one of them has its own words on screen.

This matters when reading this document: where a screenshot shows a refusal, that *is* the designed behavior for this seat, not a broken page.

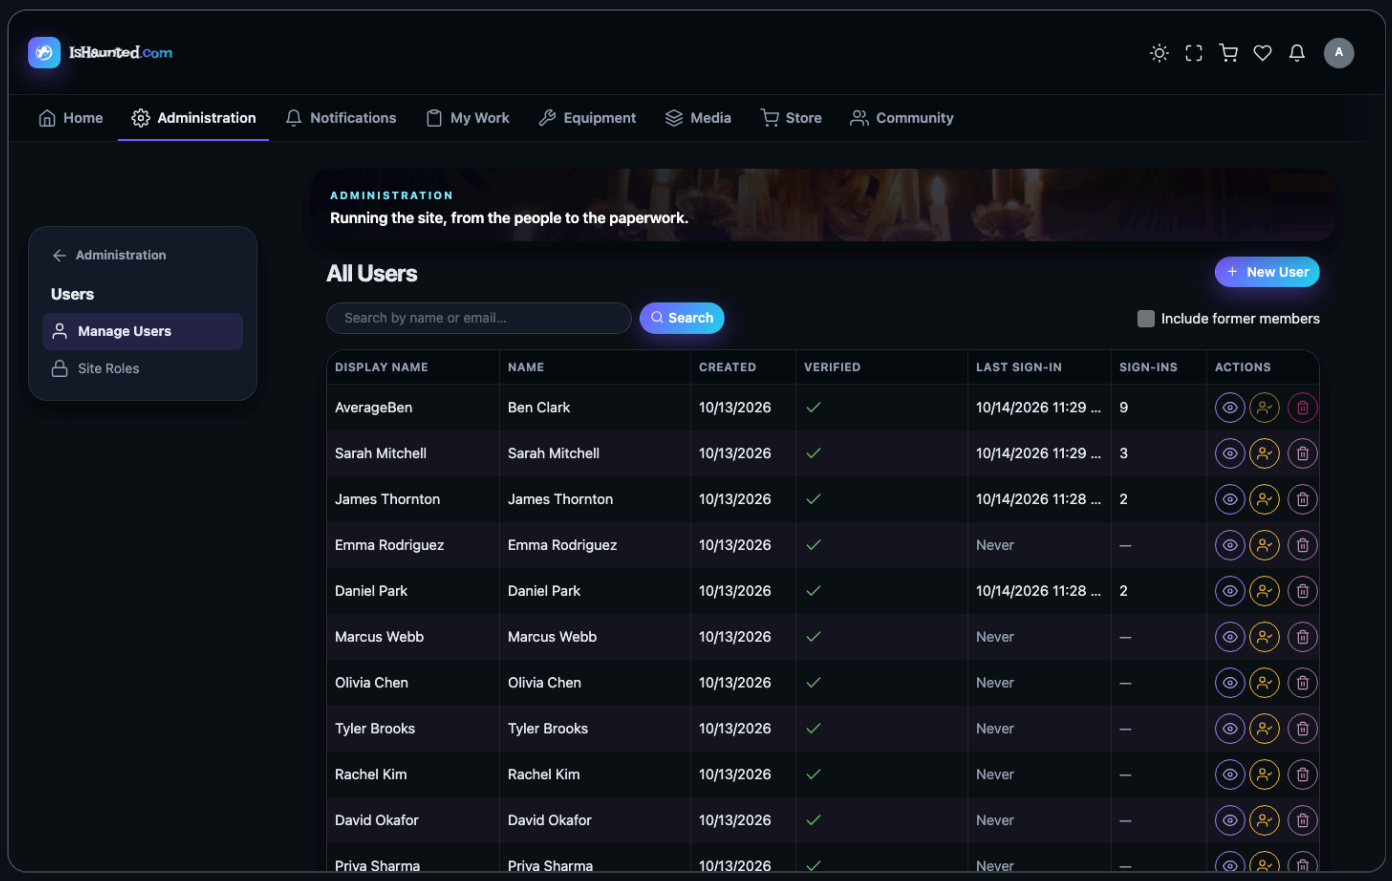

## What this user sees, screen by screen

**Dashboard.** How the site is being used. Counts accounts and their activity — visitors who never sign in are not recorded anywhere, and it says so.

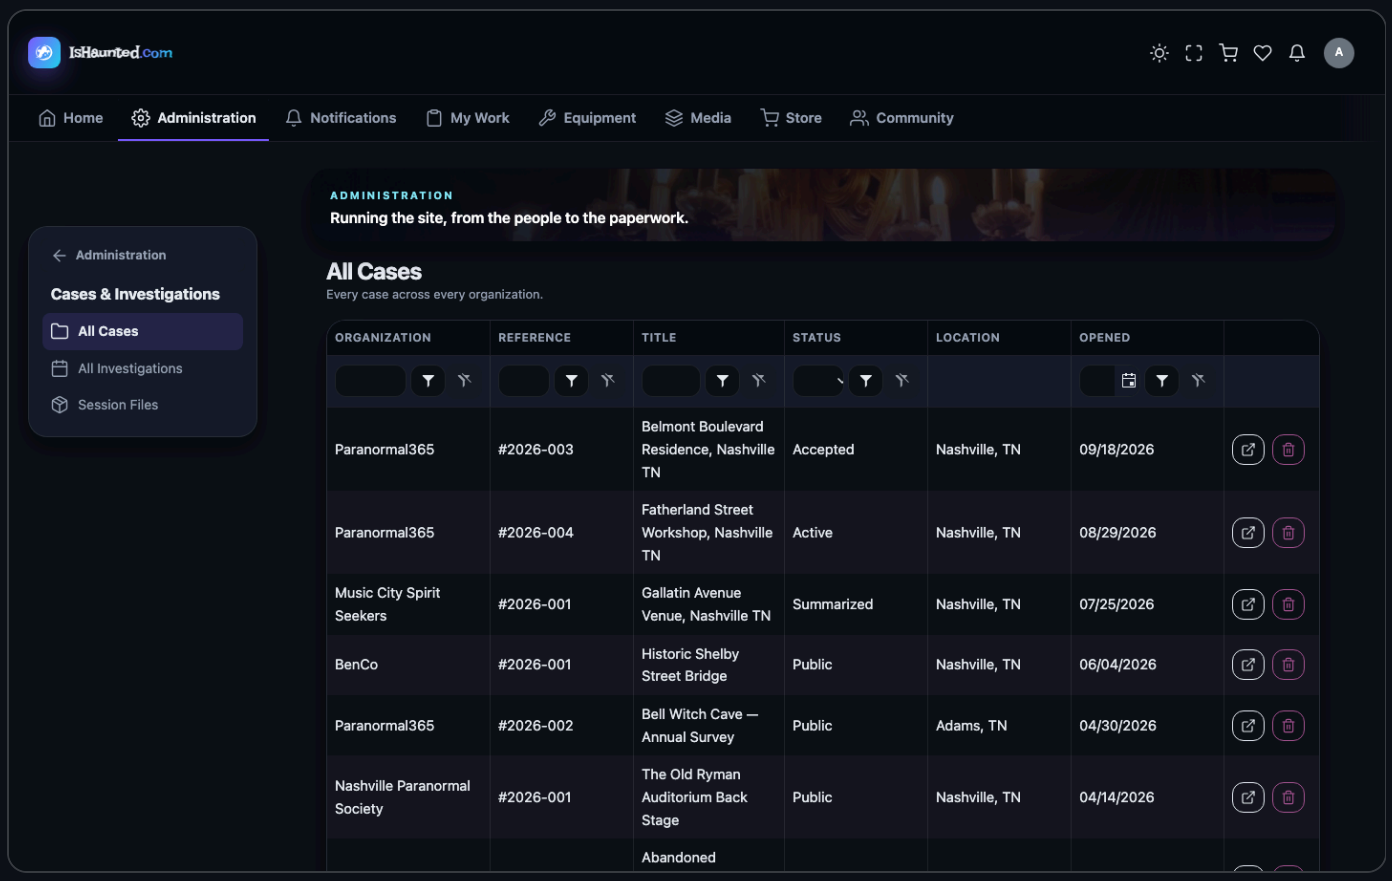

Dashboard

**Users.** Every account. The Verified column distinguishes confirmed, link-sent-not-used, and never-emailed.

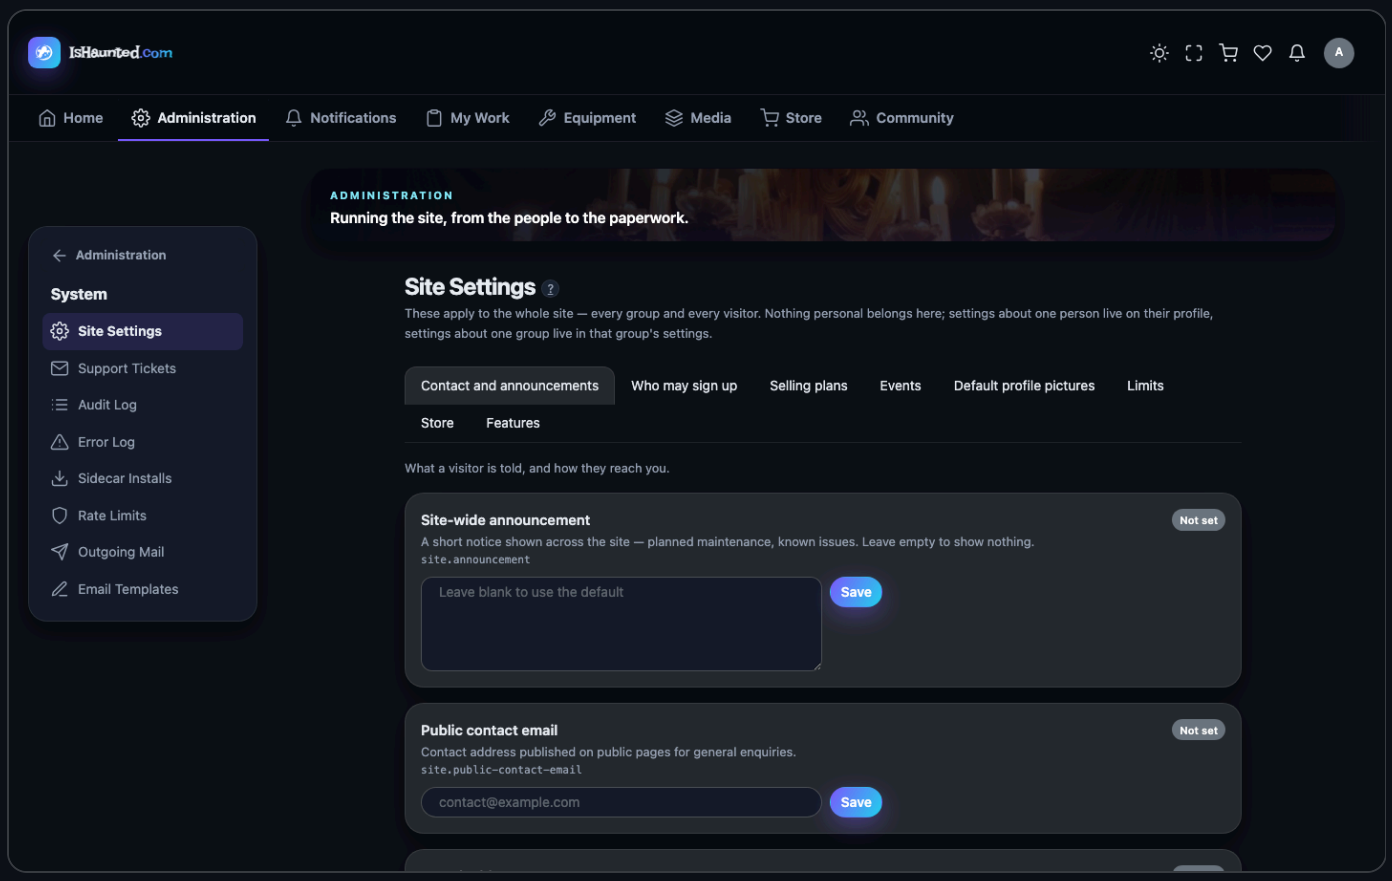

Users

**Admin cases.** Every case on the platform.

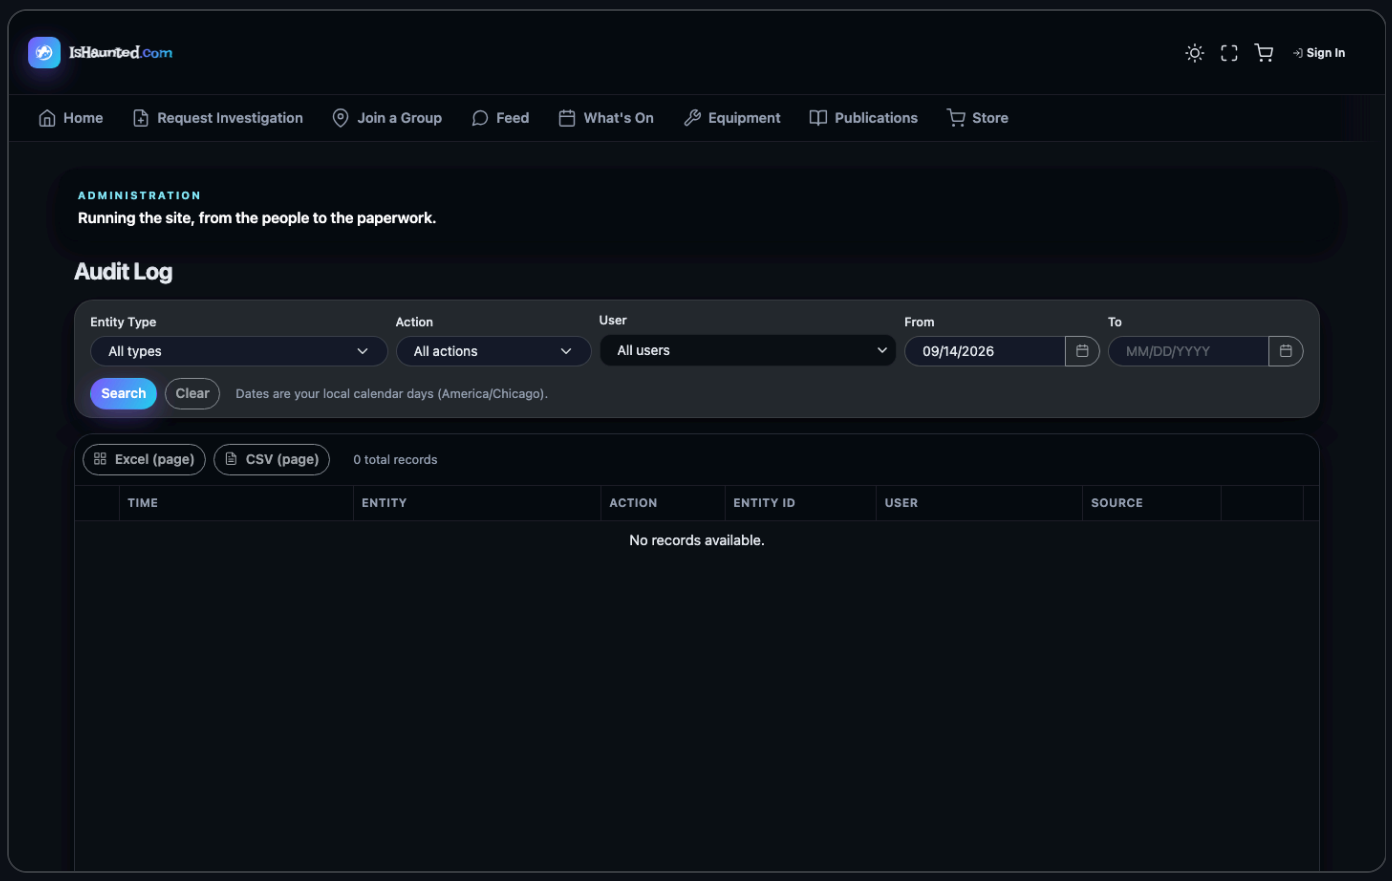

Admin cases

**Site settings.** Feature flags, announcements, and what the site offers at all.

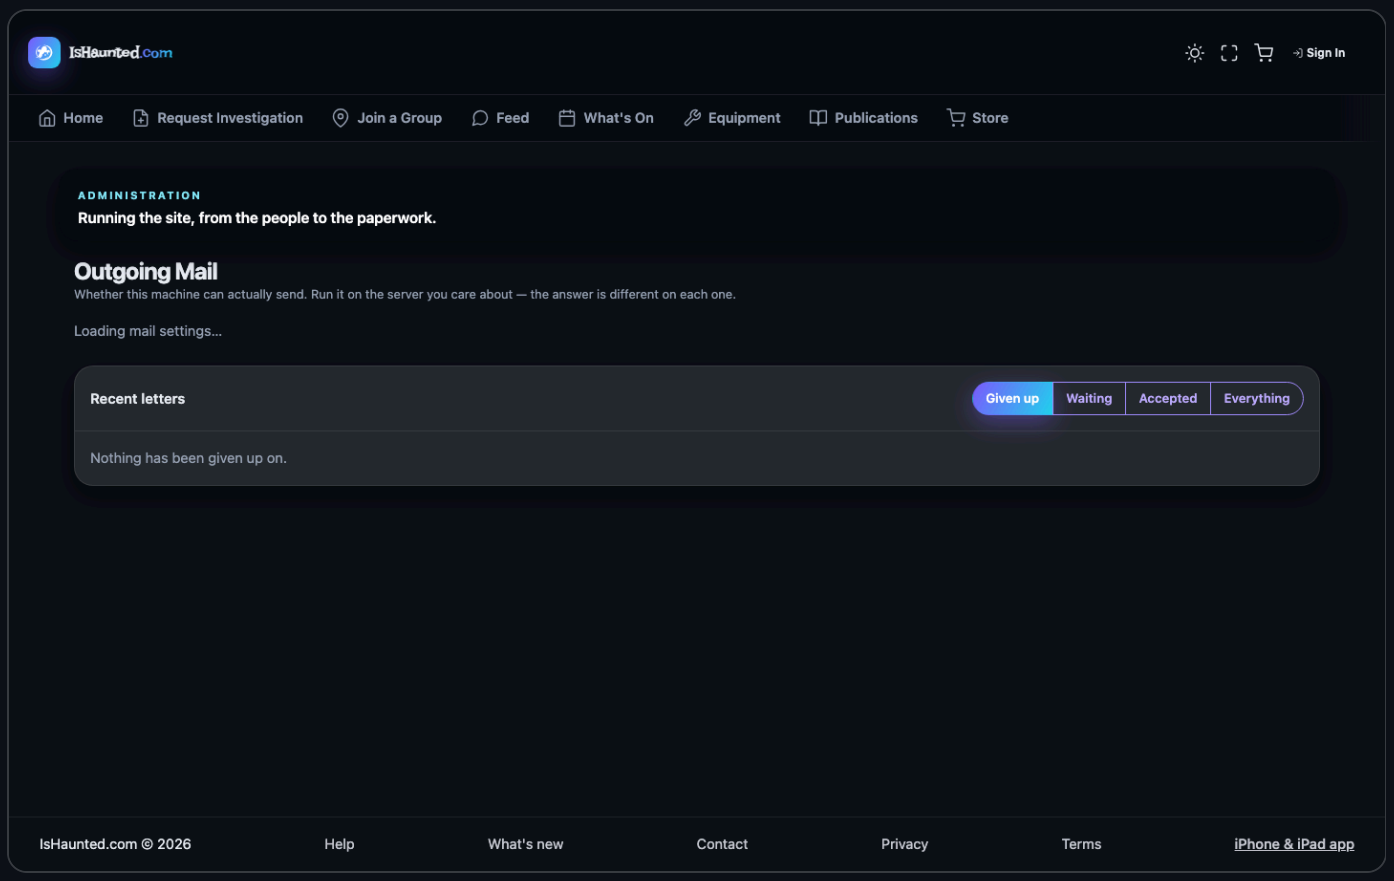

Site settings

**Audit log.** Who changed what, when. Filtered and paged on the server.

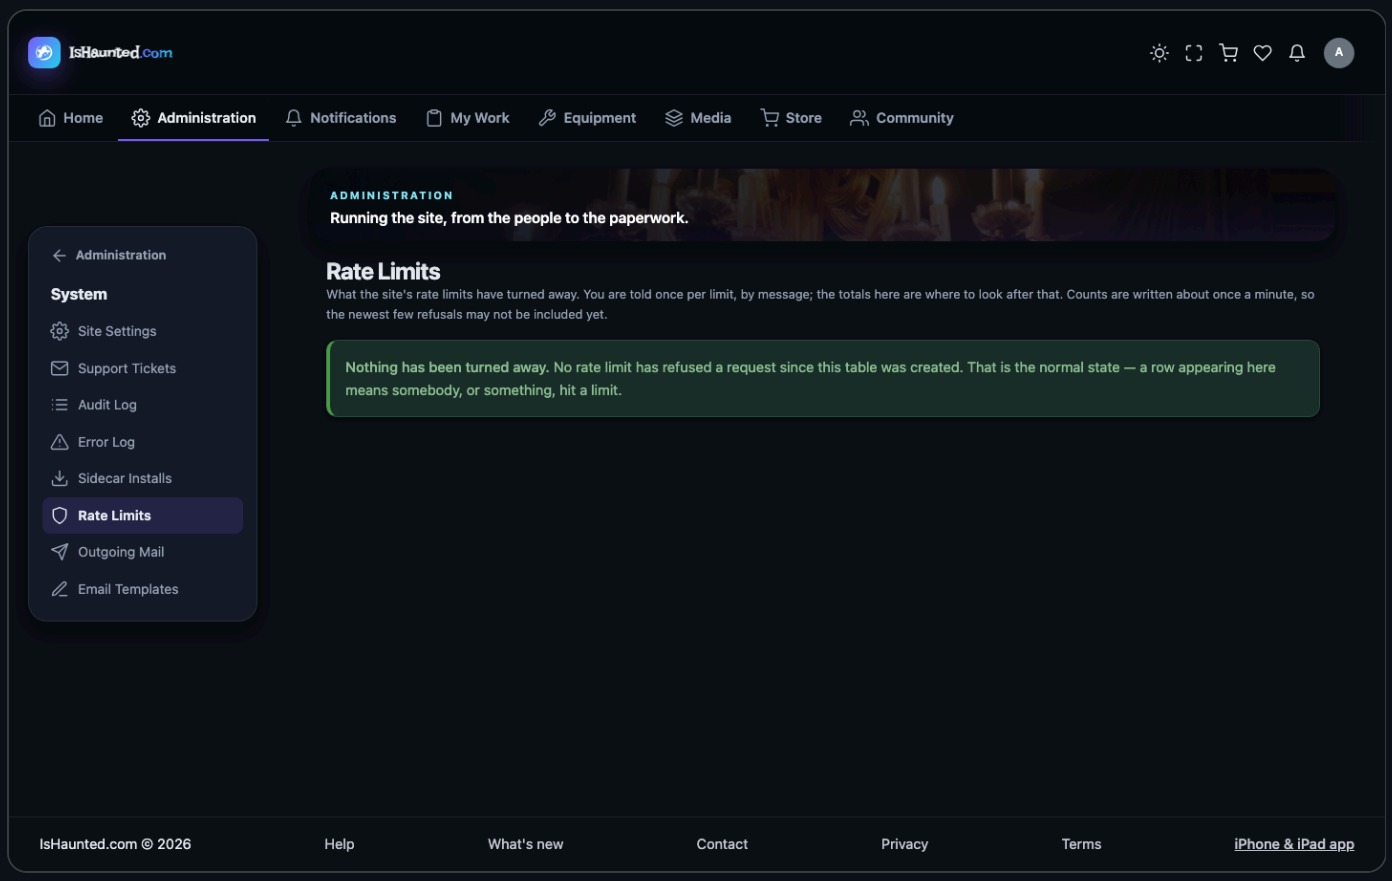

Audit log

**Outgoing mail.** Whether this machine can actually send email, and a real test send.

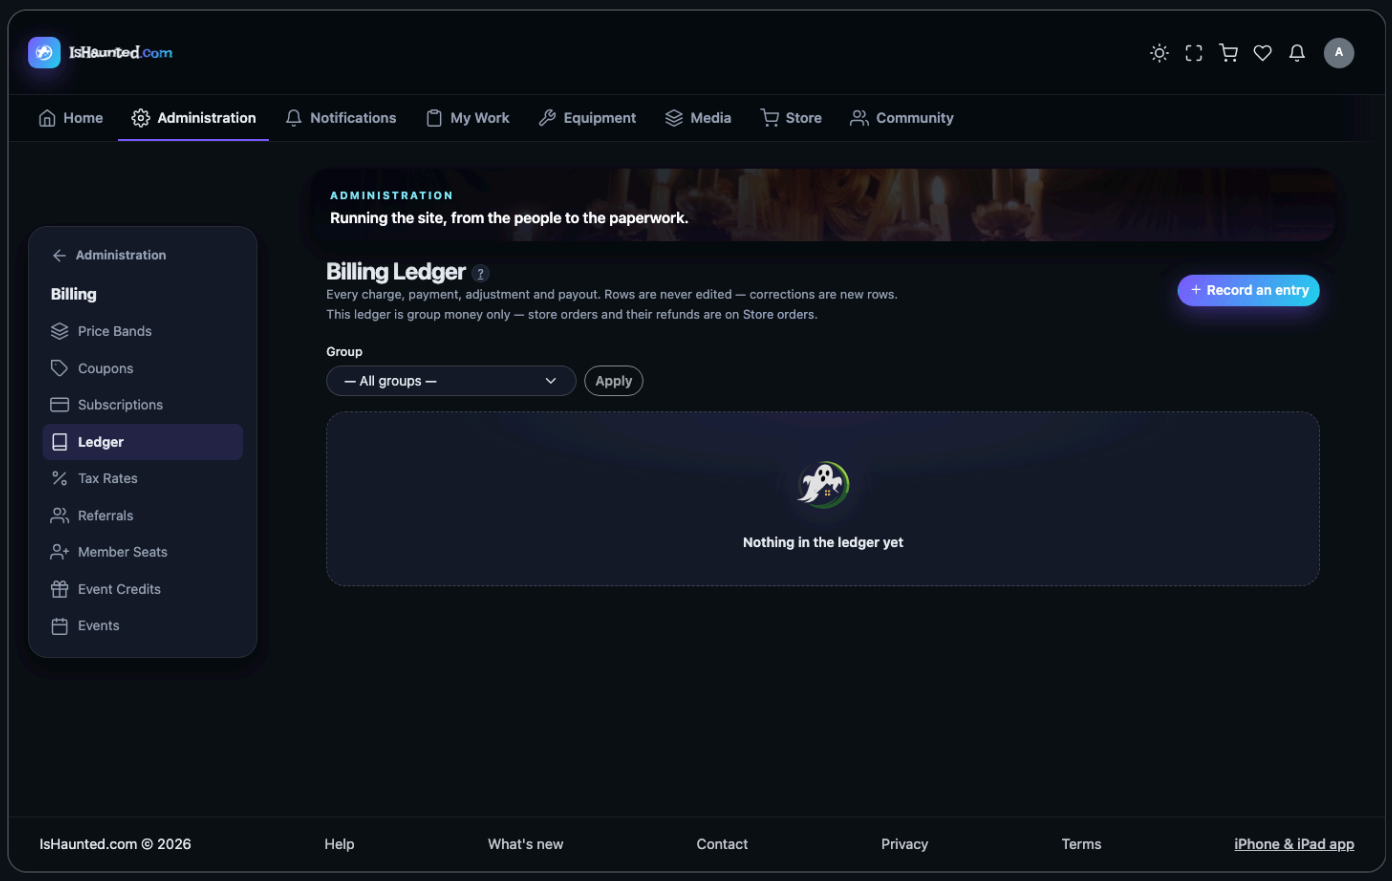

Outgoing mail

**Rate limits.** What the site's limits have turned away.

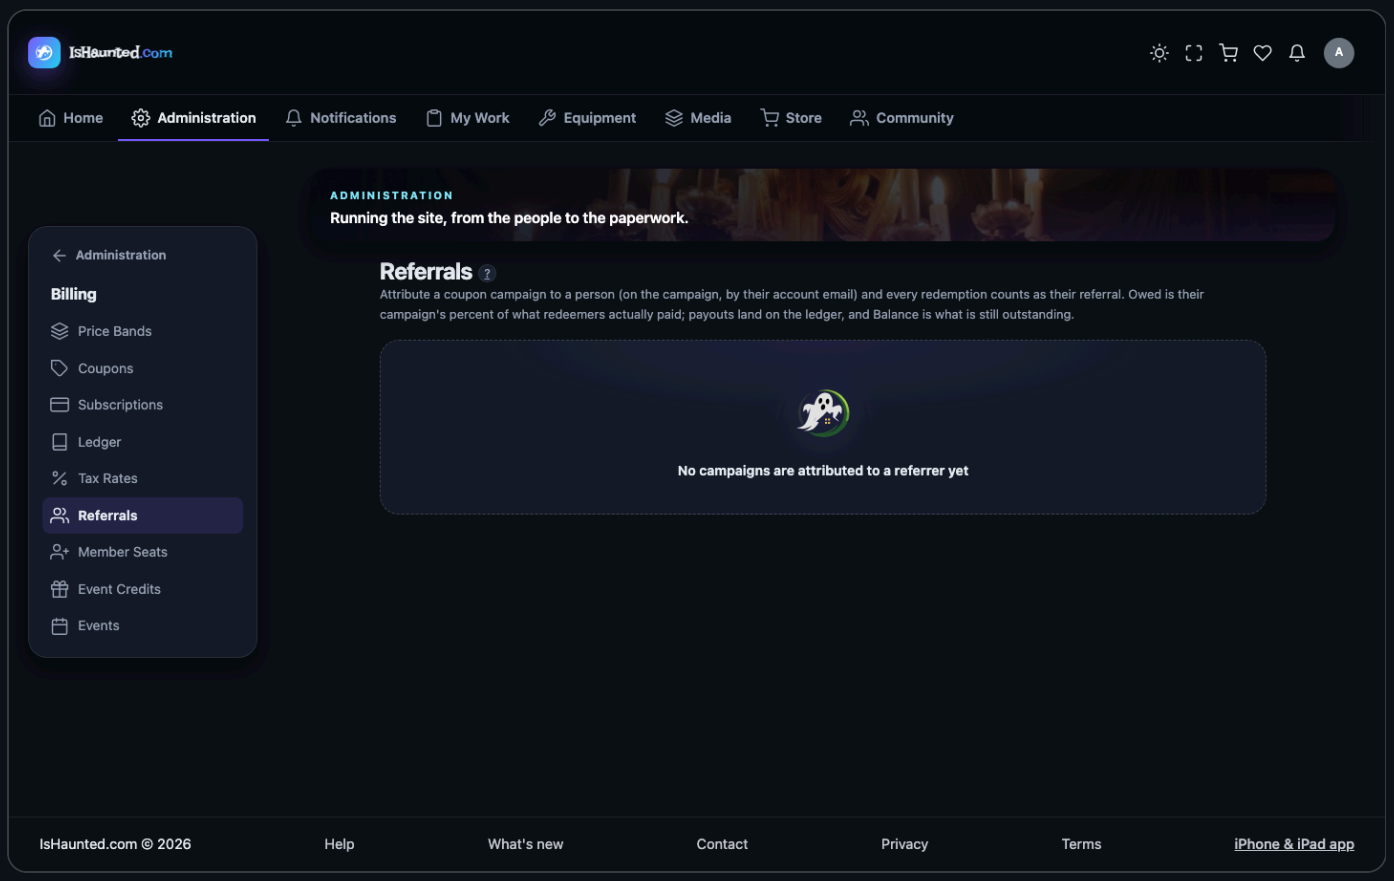

Rate limits

**Billing ledger.** The money trail, append-only.

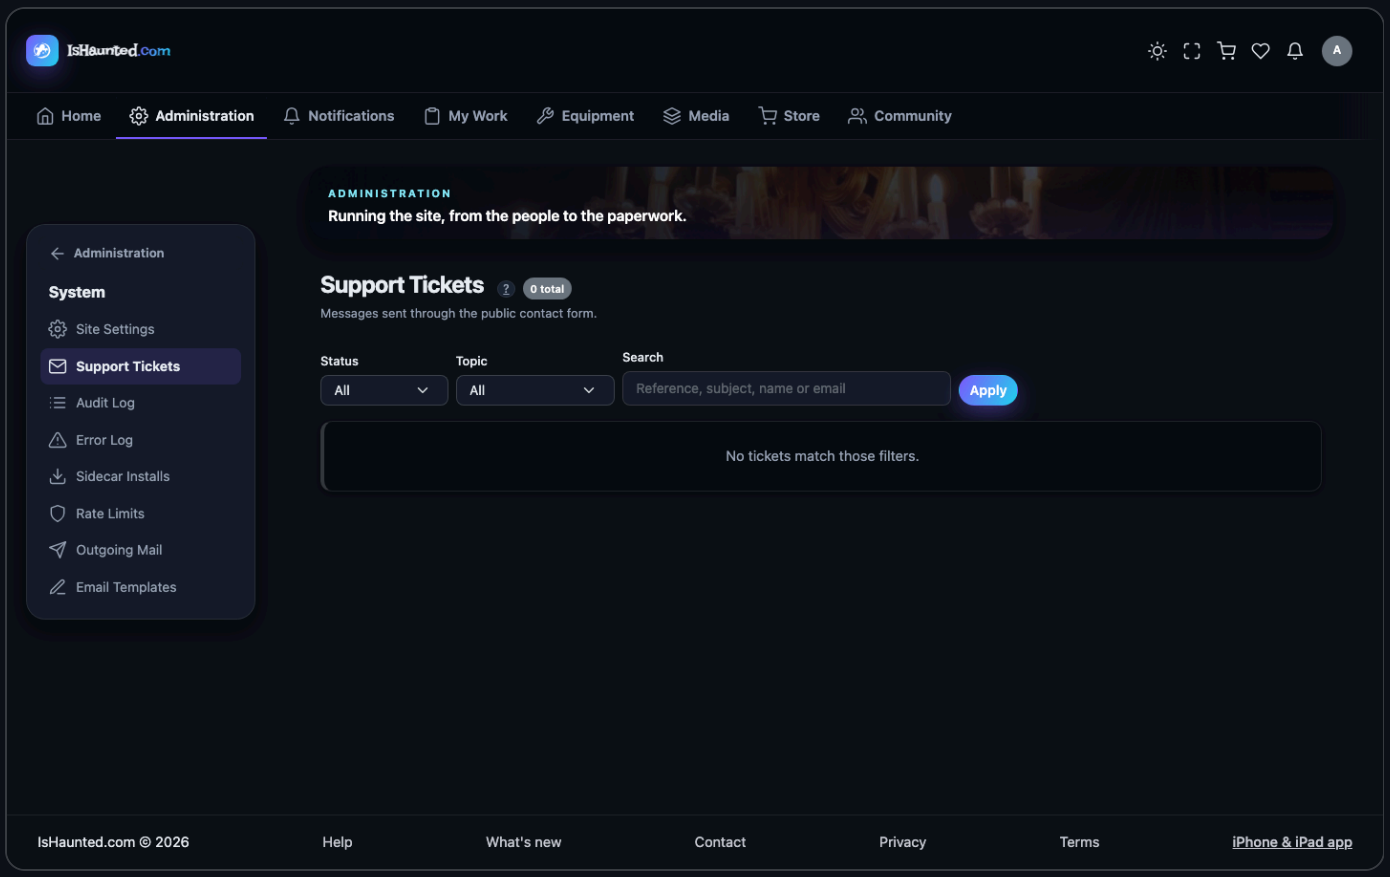

Billing ledger

**Referrals.** Referral standings and what they earn.

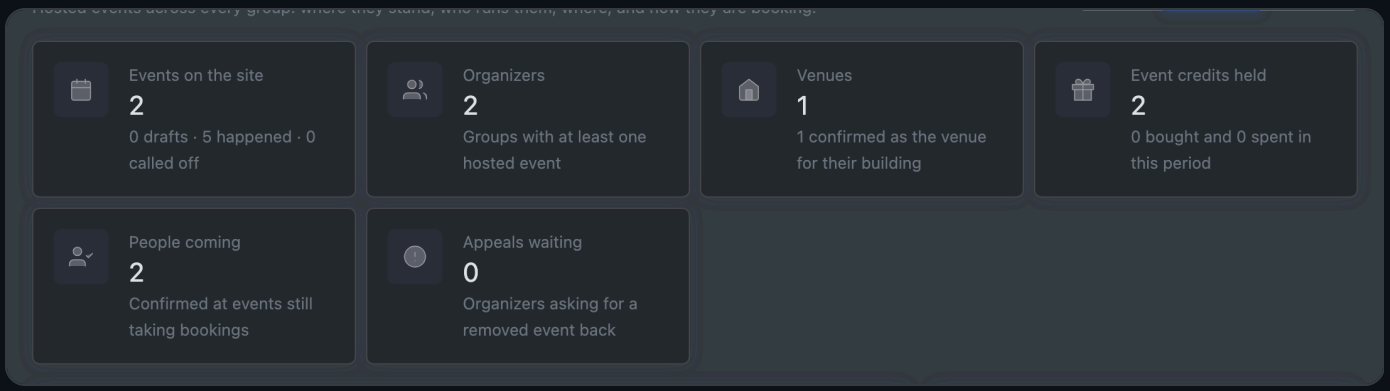

Referrals

**Support tickets.** The support queue.

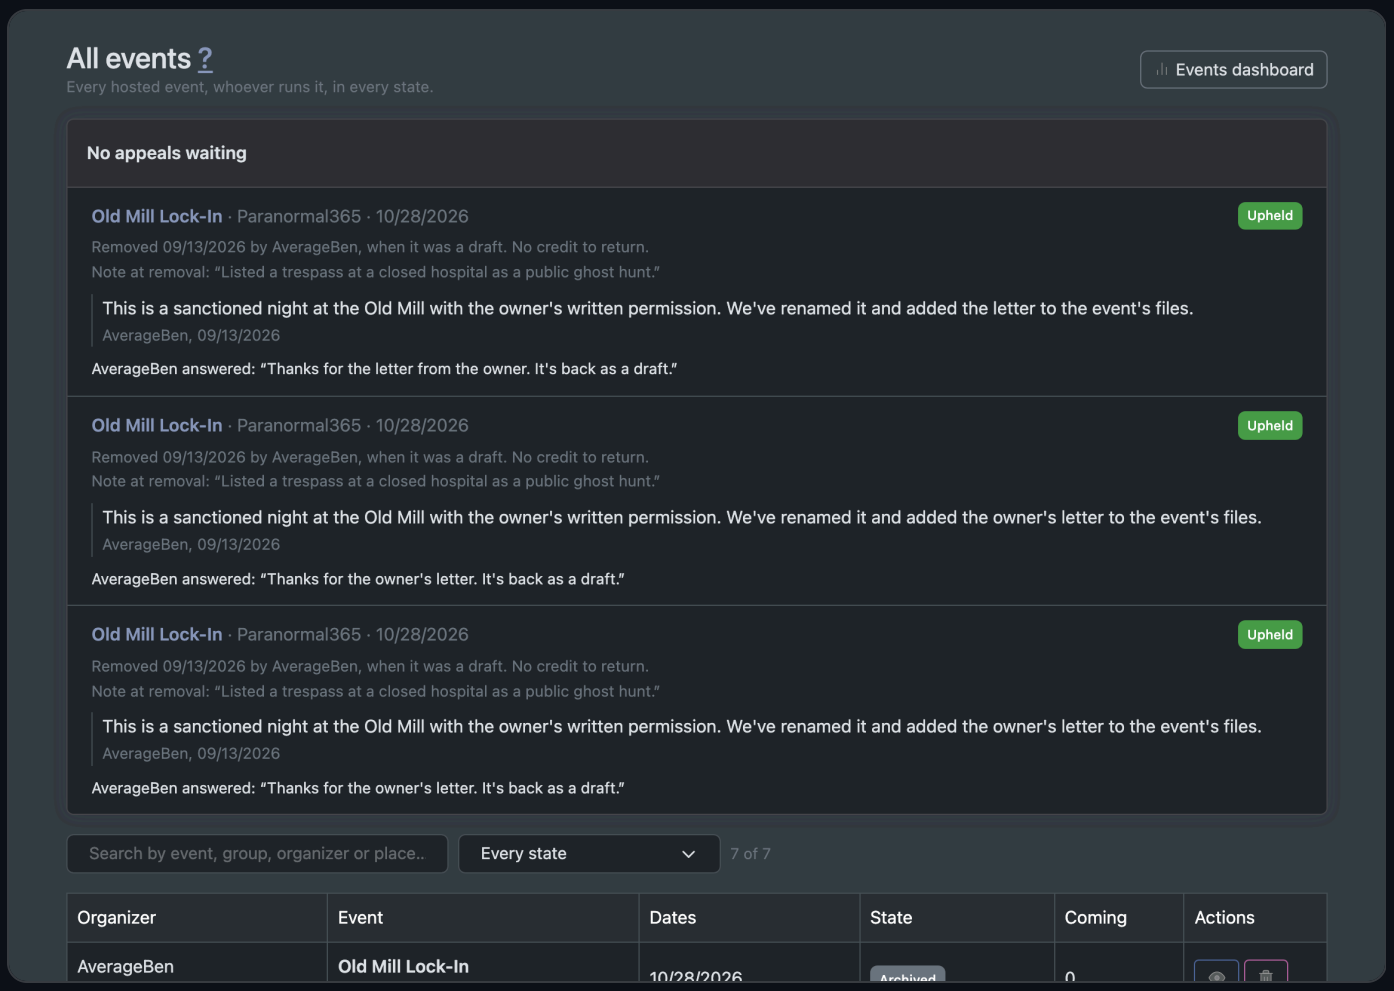

Support tickets

**Events dashboard.** Hosted events across every group: where they stand, credits, venues and appeals waiting.

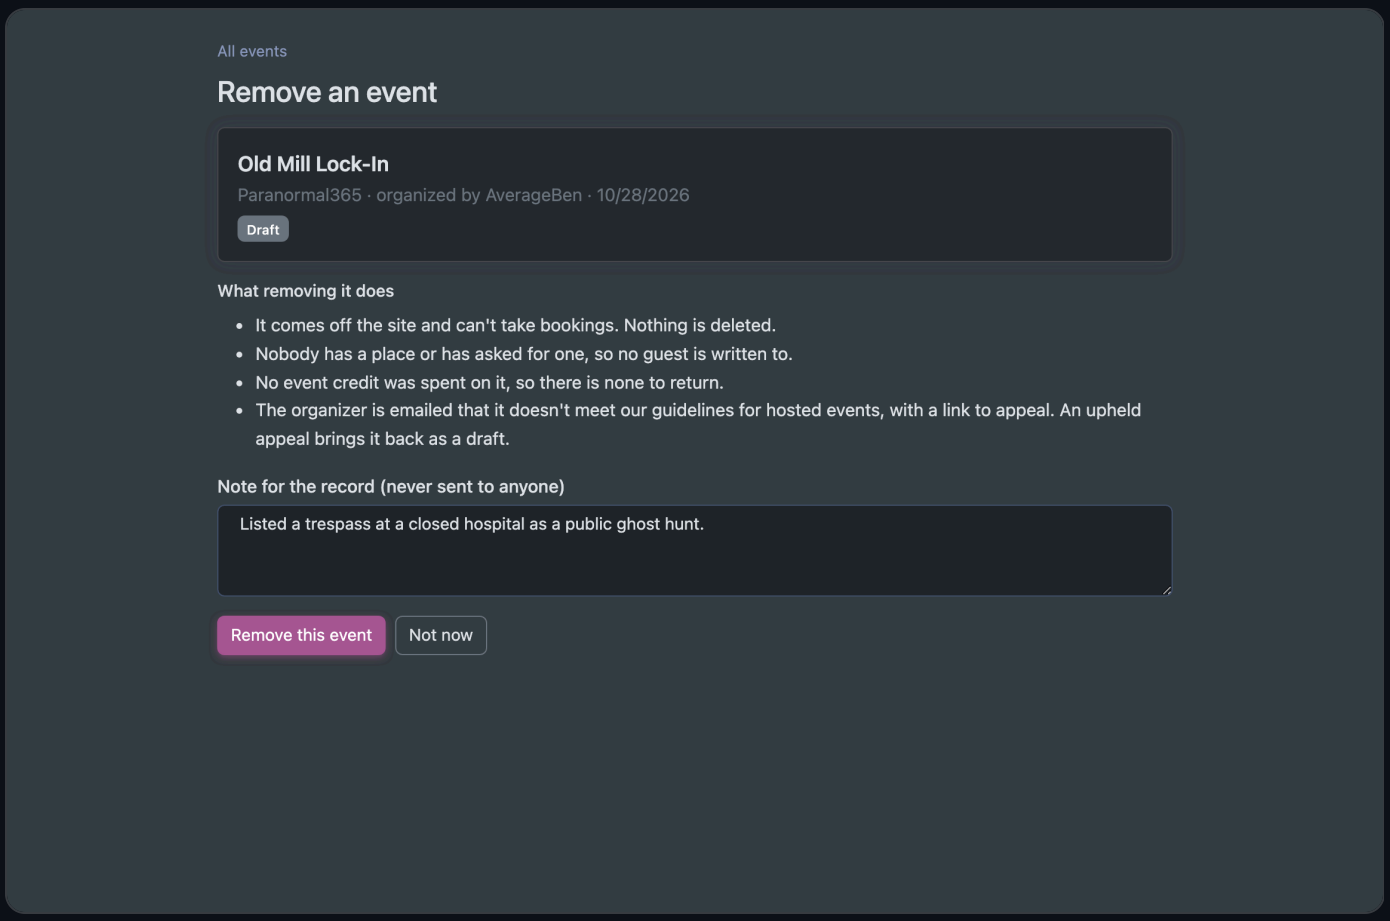

Events dashboard

**Every event.** Every hosted event, with view and remove.

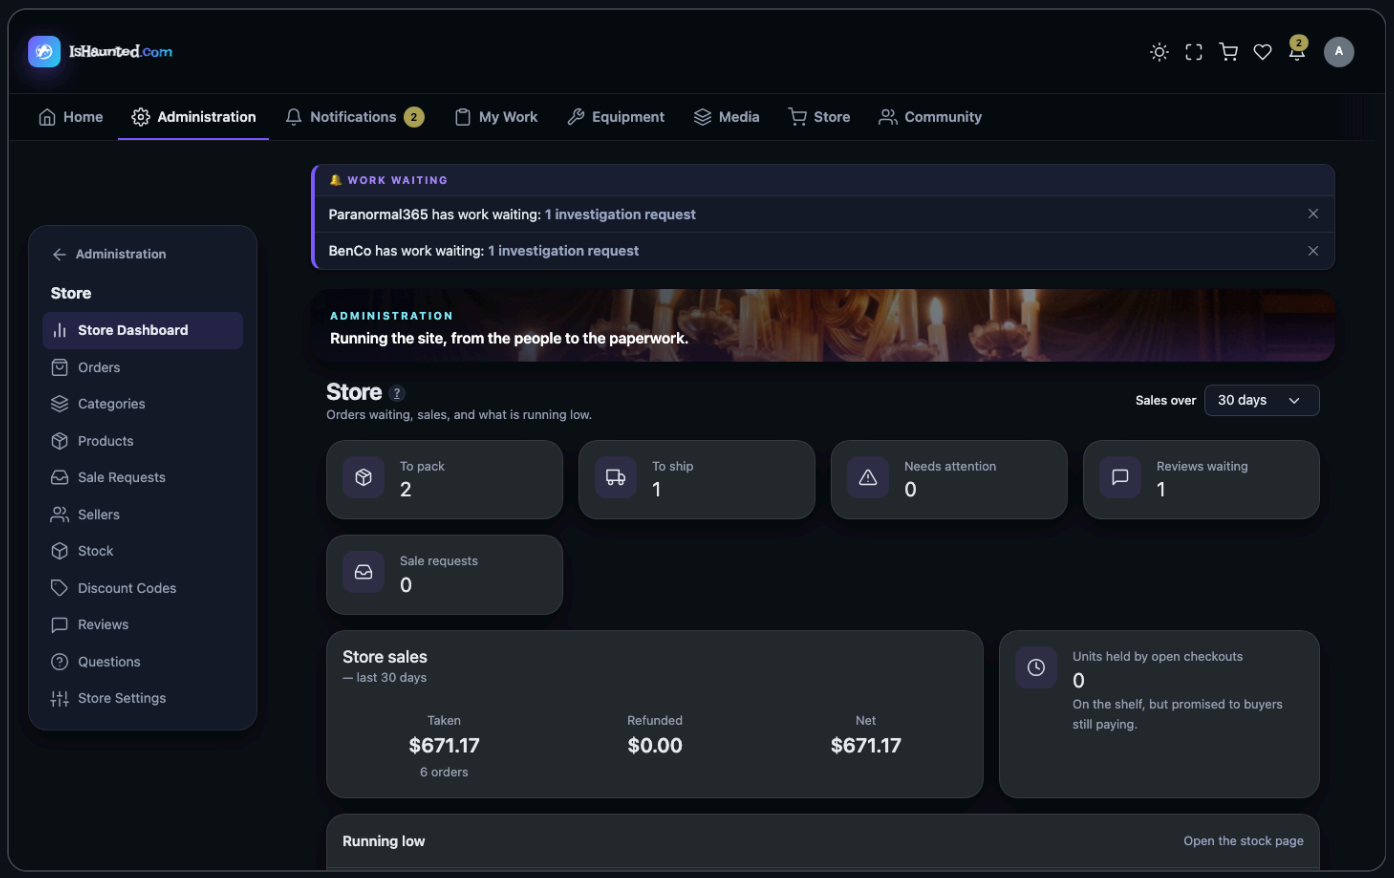

Every event

**Removing an event.** Removal says what it will do before it is done: off the site, guests told, credit returned, the organizer offered an appeal.

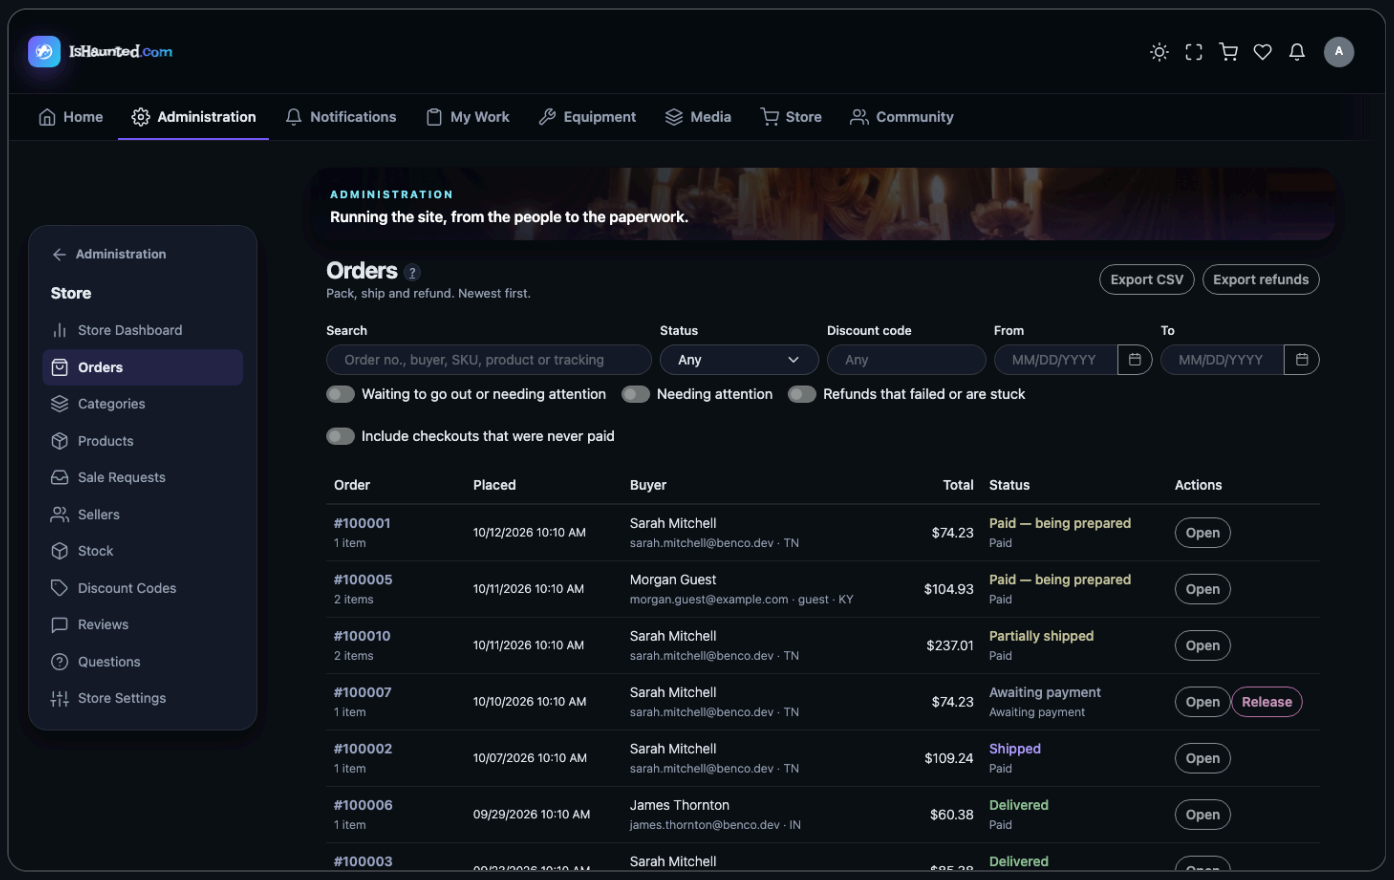

Removing an event

**Store dashboard.** The store's back office: orders to pack and ship, reviews and sale requests waiting, and what is running low. Works while the store is switched off.

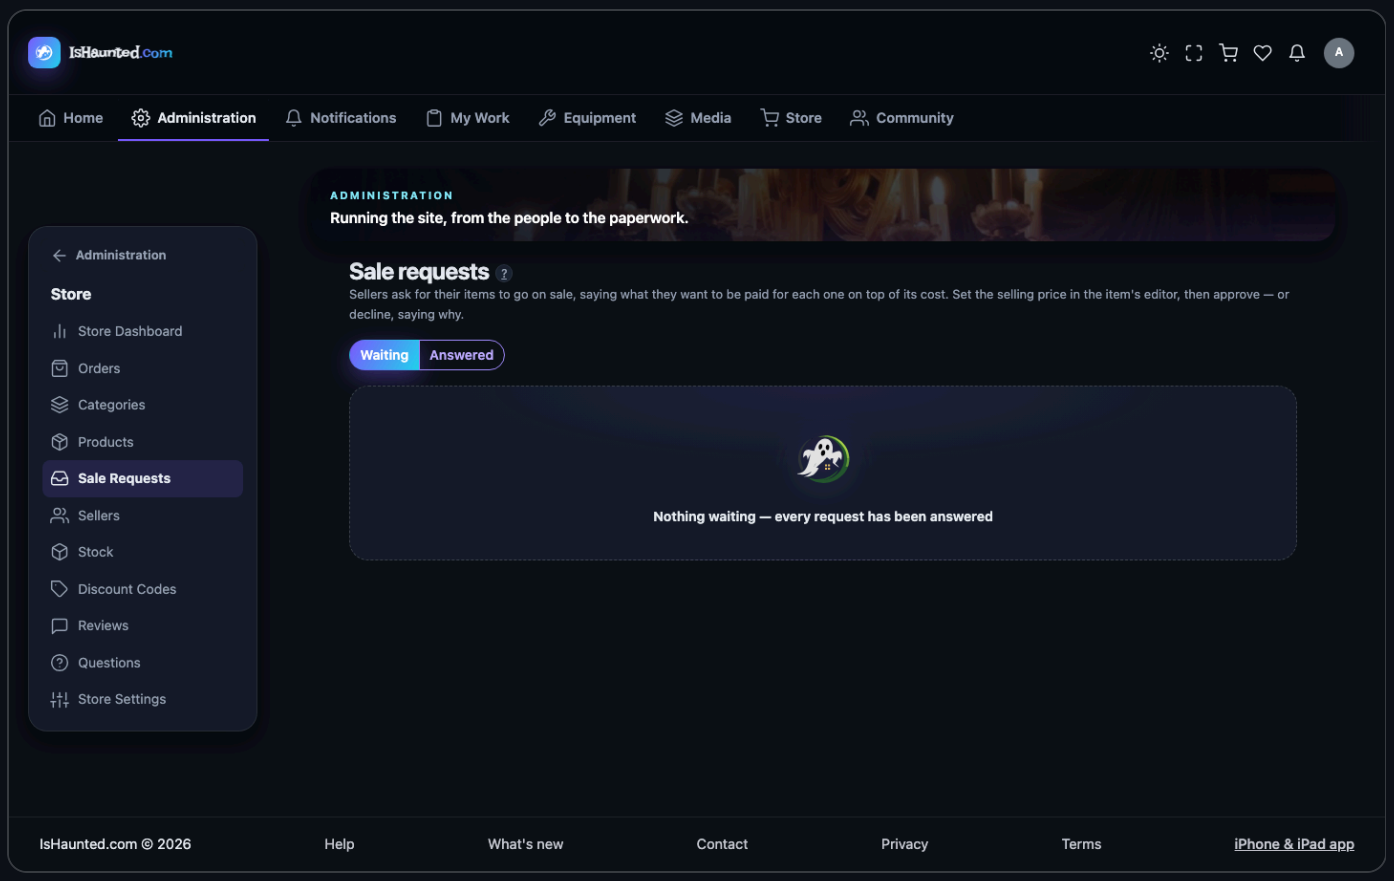

Store dashboard

**Store orders.** The order desk. Each seller's items travel as their own package, so an order can read Partially shipped.

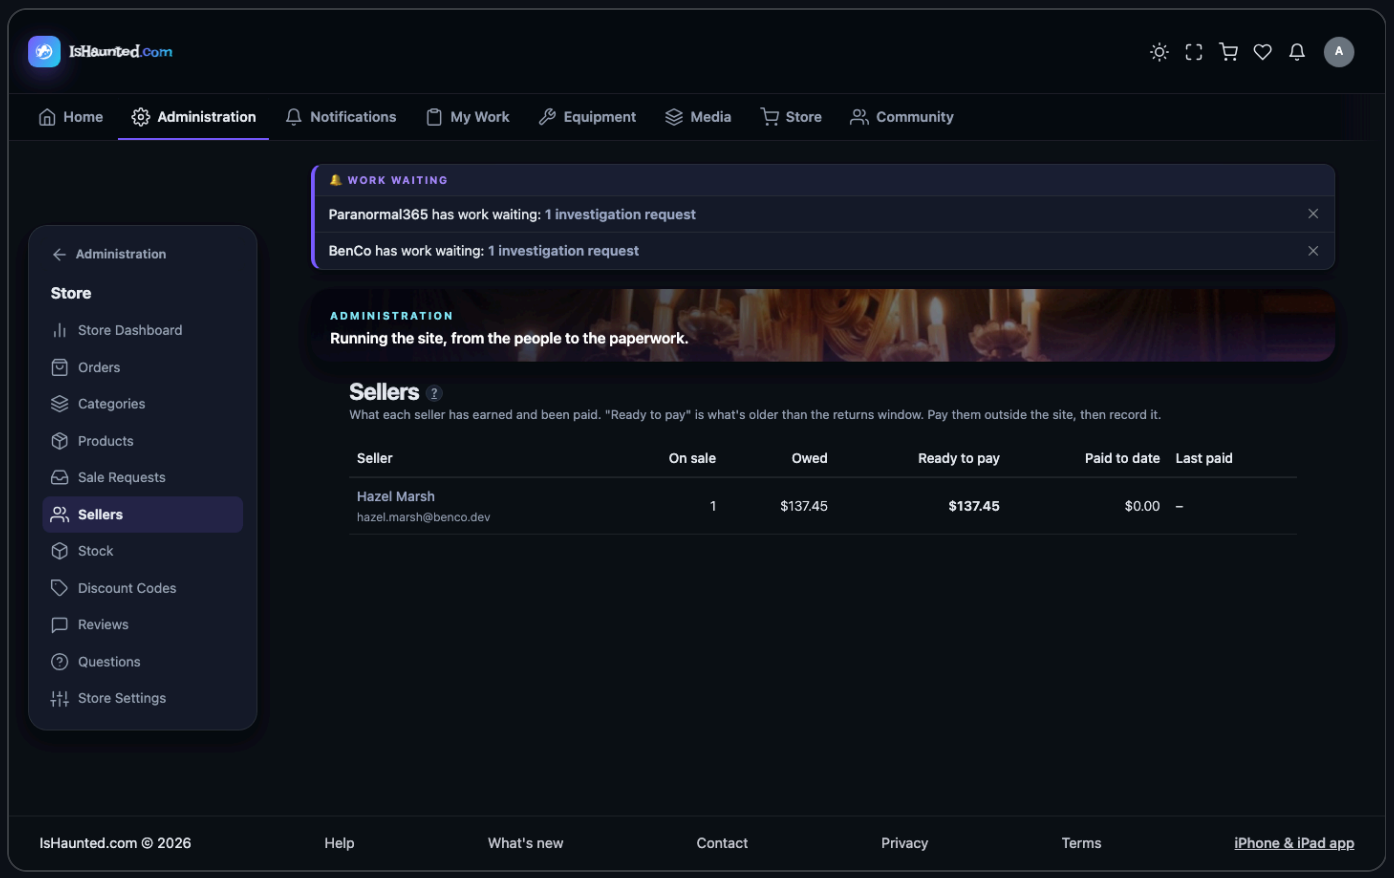

Store orders

**Sale requests.** Sellers asking for items to go on sale. The store sets the price, then approves.

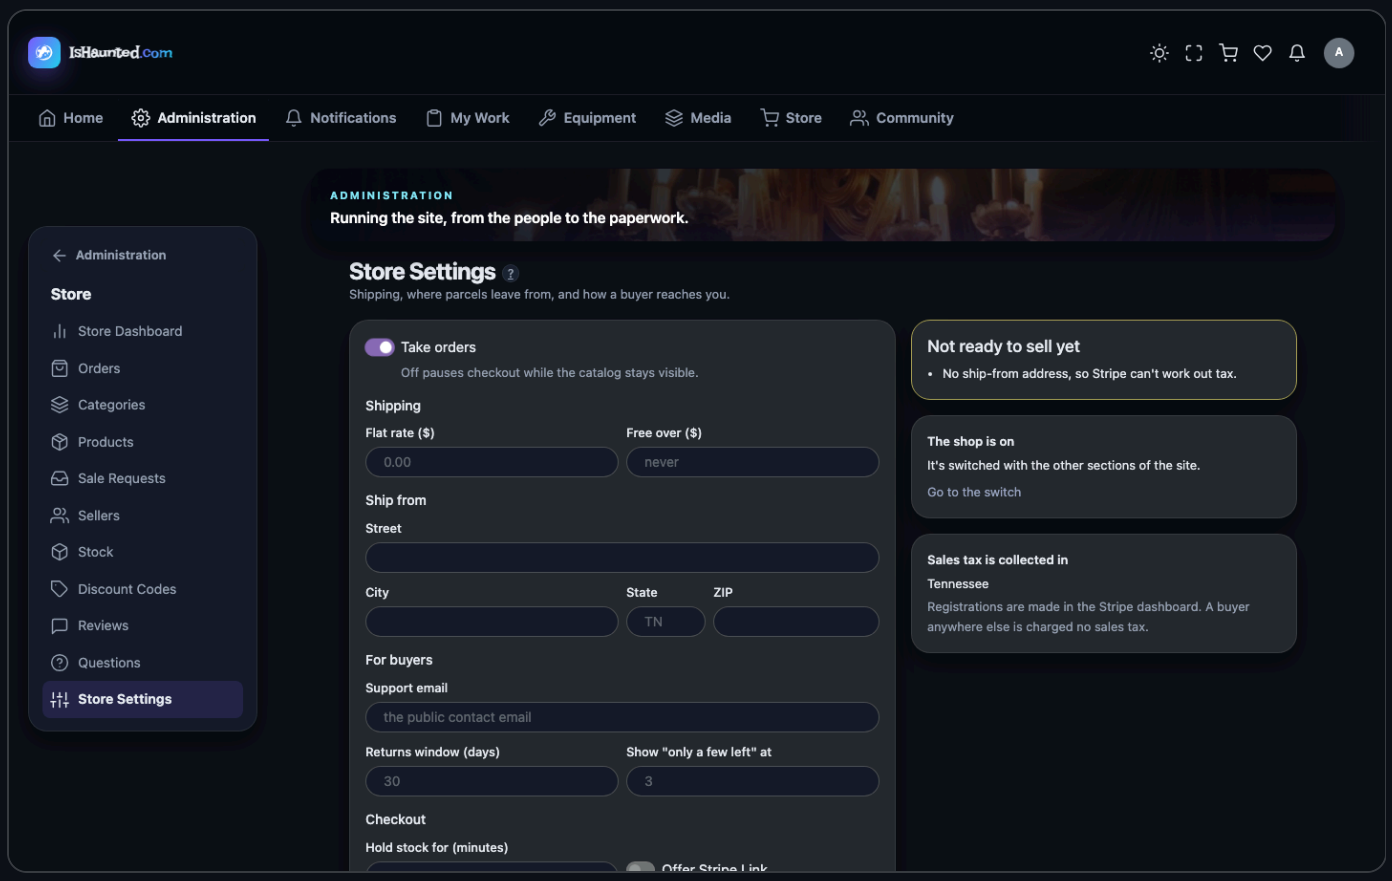

Sale requests

**Sellers.** What each seller has earned, what is ready to pay, and what has been paid. Payouts are made by hand outside the site and recorded here.

Sellers

**Store settings.** The store's settings, and the checklist that must be empty before it opens.

Store settings
