

IsHaunted.com

*The professional platform for paranormal investigation —
and the community built around it.*

Investor Overview · September 2026

Prepared by Ben Clark
Confidential — for discussion purposes

THE OPPORTUNITY

A passionate market that nobody has built for

Every town has a haunted house, and every region has the people who investigate it. Thousands of volunteer paranormal investigation groups worldwide field requests from frightened homeowners, survey historic sites, and produce photo, audio and video evidence — and today they run all of it on spreadsheets, Facebook groups, and shared drives.

This is exactly the shape of market where vertical platforms win: recurring group activity, sensitive records that deserve real tooling, media-heavy evidence that deserves real processing, a public audience hungry for the findings, and clients — the families who ask for help — who currently get no professional experience at all. No incumbent owns this vertical. **IsHaunted.com was built to own it end to end.**

THE PRODUCT

One platform, both sides of the story

For investigation groups: their entire operation

Client intake, case management, scheduled investigations, evidence files, team roles and permissions, equipment inventory and lending, calendars and public events, member recruitment, and each group's own public website — authored and published on the platform, no webmaster required. A group that adopts IsHaunted.com moves its whole working life here.

A group's hub: live membership, caseload, and activity — fourteen operational areas behind one dashboard.

A case is a complete record: overview, timeline, investigations, files, transfers, messages, reports, research, notes and video — one tab each.

Research is where a case's history gets told: each research note is a **page** built from blocks — formatted text, pictures, documents, link cards and maps — pasted or dropped in anywhere and dragged into order, the way people already work in OneNote or Notion. A page saves itself, stays a private draft until published, and takes its place on the case timeline by the date it is about. A map holds the places the investigator chose, never the client's address, with walking or driving routes between them and the distance and time of each leg.

A research page's map: the library holding the old city directories, and the cemetery where the previous owners are buried, with the driving route between them.

For everyone else: the public stage

Published cases plotted on a world map, a directory of groups searchable by location, public events anyone can attend, long-form write-ups, and a social feed for the paranormal-curious. The public side is the content engine: every case a group publishes becomes a page that recruits the next group, the next member, and the next client.

The front door: find a group near you, or ask for help.

Public investigations, live on the home page — every published case is a pin, and every pin is a story.

The differentiator: privacy engineering. A paranormal case is somebody's home.

IsHaunted.com treats that seriously in ways no general-purpose tool can: camera GPS data is stripped from served media while originals are preserved as evidence; client names are replaced with pseudonyms on every public page; published locations are generalized to the area, never the address; and the platform detects a client's name in a report before it goes public and warns the author. This is deep, tested machinery — and it is also the paid product (below).

BUILT-IN MEDIA PRODUCTION

The evidence pipeline is the product

Paranormal investigation runs on media, so the platform doesn't stop at storing files — it processes them. A browser-based **video editor** (multi-track timeline, overlays, callouts, keyframes, export) ships inside the product, with an optional native helper app that renders at full speed on the investigator's own machine. Server-side **EVP detection** scans audio evidence for anomalies automatically, behind an accuracy-gated test suite. Waveform players, spectrograms, clip extraction and multi-track case mixes round out the audio bench.

The built-in video editor: project files, media library, multi-track timeline, ripple editing, native-speed export via the helper app.

Nobody else in this vertical ships an editor, a detector, or a provenance trail. A group that cuts its evidence reel here has no reason to leave.

COMMUNITY

The feed: from audience to members

The community layer is live in the product today: member profiles, @handles, following, hashtags, and a moderated feed. The full front-door arc is now built and dark-launched — anyone can scroll without an account; posting means joining or founding a group; every photo and video is screened on our own servers before it appears; and groups' promoted cards ride the feed, served nearest the viewer first. One switch turns it on.

The feed: mentions and tags become links; moderation is built in.

Long-form publications: groups write up findings under their own masthead.

A THIRD CUSTOMER

Hosted events: haunted weekends, sold out

Haunted hotels, historic theatres and event companies run séance weekends, dinners and evenings of evidence, and sell them with a web form and a spreadsheet. IsHaunted.com now runs the whole thing: the venue's rooms or a seat plan, bookings with holds that lapse on their own, confirmations carrying a QR pass, a door that checks people in by scan or by name — with no signal, on the iPhone — menus and dietary sheets for the kitchen, a programme guests sign up for, and a room where guests share photos.

Venues get a public page and say which organizers may host under their roof; IsHaunted keeps it trustworthy with an events dashboard, removal with the credit returned, and an appeal a person reads. The model is simple and additive: **\$99 an event credit**, however many nights, or unlimited events on a business plan — and **guests pay the venue directly**, so there is no ticket fee to compete on and no guest money to hold.

A hosted event's page, with the venue's photographs, the nights and what is left.

The door on the iPhone: scan a pass, tap the party, check them in — offline.

WHAT EXISTS TODAY

Built, tested, and deployed

The platform is deployed at **ishaunted.com**. This is not a prototype and not a deck — it is a working product with production-grade engineering discipline:

- Full case lifecycle: intake requests, case records, timelines, investigations, findings, reports
- Research pages: a reusable block editor with autosave, private drafts and publishing, maps with walking and driving routes, and link cards fetched safely on our own servers
- Formatted case descriptions, notes and client messages, cleaned before they are stored
- Browser video editor with native helper app for full-speed rendering
- Server-side EVP detection with an accuracy-gated fixture suite
- Audio tooling: waveform players, spectrograms, region notes, clip extraction, case mixes
- Evidence metadata: EXIF/GPS extraction on every upload into an audit table; location stripping from served copies; derived clips inherit the recording's provenance
- Per-group public websites (CMS): pages, layouts, logos, embedded cases and galleries
- Equipment: personal and group inventories, a moderated global catalog, lending with condition photos

- Events: public listings, RSVPs, attendee evidence submission, reminder automation
- Hosted events: room and seat plans, holds, a booking board, QR passes, staff and the door, menus and dietary sheets, programmes, files, a guest photo room, venue approval, reviews, and SuperAdmin oversight with removal and appeals
- Ghost walking tours: tour pages, dates, capacity, reminders with the guide, and reviews
- Roles & permissions: per-group custom roles with per-table grants, tier-aware
- Community: profiles, @handles, following, hashtags, and the full public feed — anonymous scroll, ranked timeline, photo and video posts screened on our own servers before they appear, and a classifier that learns from every moderator decision
- Group discovery by location, by kind (investigation groups and ghost walking tours), and group-authored promotional ads with platform review, served nearest-viewer-first
- Native iPhone and iPad app on the same API, running on device today
- Field Kit: the phone as an offline recording instrument, replayed on either side
- Billing: tiers by member count, contract-terms freezing, coupons, referral tracking, event credits, an append-only financial ledger with receipts and per-state tax, card payments through Stripe, a buy button on every plan, and a switch that takes plans off sale
- In-app help system with full product documentation, generated to PDF

Engineering discipline as an asset: more than 9,100 automated unit tests across the server, website and media tooling, 440+ in the iPhone app's core library, and a 700+ scenario browser test suite run against every change; an append-only audit trail on financial records; additive-only database migrations; and a documented decision record covering 180+ tracked product items. The codebase is built to be operated, audited, and grown.

BUSINESS MODEL

Free where it grows, paid where it matters

The pricing principle: charge for the work that carries responsibility, never for the activity that grows the community.

Free lane	Paid lane
Public-place investigations — landmarks, historic sites, businesses — including full public publication of findings. This is the content engine and the recruitment engine, and it stays free.	Private-residence and client work — taking a family's case, working it, and publishing redacted findings from it. The privacy machinery (pseudonyms, location generalization, media stripping, name detection) is the product being bought.

Price Bands?

Reshape the ladder
New Band

Members	Caps	Role areas	Capabilities	Groups	Active	
1–10	Open cases: 10 Equipment: 40	☒ Profile ☒ Membership ☒ Cases ☒ Investigations ☒ Equipment ☒ Public pages ☒ Files ☒ Clients ☒ Calendar	☒ Case transfers ☒ Audio/video location stripping ☒ Private-residence cases	1	✓	Edit
11–∞	Open cases: unlimited Equipment: unlimited	☒ Profile ☒ Membership ☒ Cases ☒ Investigations ☒ Equipment ☒ Public pages ☒ Files ☒ Clients ☒ Calendar	☒ Case transfers ☒ Audio/video location stripping ☒ Private-residence cases	1	✓	Edit

The billing machinery is built: price bands by member count, per-band feature areas, capability gates, and caps — administered live.

Revenue levers, designed and largely built:

- **Subscriptions by group size** — tiered bands priced per member count, monthly or yearly, with contract terms frozen per period (a group always keeps what it bought).
- **Overflow seats** — when a group outgrows its band, new members can subscribe individually rather than forcing the whole group up a tier. Built; priced per band.
- **Capability gating** — per-tier switches over discrete features (case transfers, audio/video location stripping, private-residence casework), each enforced server-side with honest, upgrade-aware messaging in the product.
- **Referral program** — per-referrer coupon campaigns with frozen-money attribution and a commission ledger; referral links land visitors on pre-discounted pricing.
- **Event credits** — \$99 publishes one hosted event however many nights it runs, good for a year and returned if the event is called off in time; business plans host without limit.
- **Tour operators** — ghost walks priced per tour, not per guide, with every date included.
- **Group promotion** — groups author ads, the platform reviews them, and placements run across the site; location-targeted feed placement is on the roadmap below.

WHERE IT GOES NEXT

Upcoming features

Feature	What it is	Status
The feed, as the front door	An addictive, scrolling social feed for the paranormal-interested — anyone can scroll; posting and participation require joining or founding a group, making the feed itself the recruitment funnel. Group ads served by viewer location, interleaved with prompts to start your own group.	Built and dark-launched: the full arc — anonymous scroll, For You ranking, photo and video posts with automatic on-server safety screening, experience-type categories with a learning classifier, video-editor renders posting straight to the feed with recorded consent, group attribution, and geo-fed promoted cards with counted click-throughs — ships behind one switch, ready to turn on.
Private-case privacy, end to end	Write reports using real names freely; the platform substitutes pseudonyms and neutral labels ("the family", "the homeowner") on every public surface automatically, and lapsed subscriptions safely unpublish rather than expose. The core of the paid lane.	In active development now — data model and designation shipped; display-time redaction, plan gates, and lifecycle handling in progress.
Payments integration	Card processing for subscriptions, overflow seats and event credits on top of the existing billing domain (tiers, contracts, ledger, receipts, tax).	Live. Stripe checkout and webhooks feed the same ledger the manual path uses.
iPhone & iPad app	Native Swift app — one universal build for both devices — for investigators in the field: capture, upload, and the feed on the device they already carry on every investigation. Talks to the same API as the website, so it is the same account and the same data, with the same privacy rules enforced identically.	Running on device, and feature-complete for its first phase. Sign-in with two-step codes, the full feed with camera capture, notifications, cases and their timelines — including logging what happened, with photos, from the scene — investigations with a map of where you've been, and public events with RSVP and add-to-calendar all work against the live API today, as does Sign in with Apple — the server validates Apple's token and links it to an existing account by verified email rather than creating a duplicate. Submitted to the App Store; hosted-event passes that open offline, the event's programme and menus, a door scanner that works with no signal, and sharing photos to an event from the Photos app have been added since.

Field Kit	The phone used as an instrument during an investigation, offline. It records magnetic field (magnetometer), sound level, position, heading and floor-to-floor altitude change, with photos, video and audio captured into the same session, EVP question-and-answer marking, and a sentry mode that watches an unattended device for magnetic, sound, motion and camera-movement events. Sessions replay on the phone and on the website on a single playhead — trace, map, compass and media moving together. Notes can be spoken and transcribed on the device itself — offered only where the hardware can do it with no connection, since the whole feature exists for buildings with no signal. Everything recorded carries the room the operator named, because a fix indoors covers the whole building and cannot tell one room from another.	Working end to end. Recording needs no signal and no account; uploading is a separate step, file by file, with checksums verified on arrival and a per-file record of what has reached the server. Sessions export as a published, open format (IsHaunted Device Data Format v1) that any instrument maker can write — the phone is the first device implementing it, and exports are validated against the format's own schema in the test suite. Uploaded sessions are citable in the case report the client receives , so the field work reaches the deliverable rather than stopping at the system.
Ghost walking tours	Tour operators are a second kind of business on the same platform — public by default, with their tours listed and reservable, and a filter that lets a visitor in a strange city find them. Investigation groups that also run paid tours are found under both without registering twice.	Built. Widens the addressable market beyond investigation groups at essentially no additional platform cost.
Group white-label	Custom domains and branding for a group's public site — a high-perceived-value premium tier on machinery (per-group CMS) that already exists.	On the priced-lever roadmap.

WHY THIS TEAM SHIPS

Velocity

Everything pictured in this document was designed and built by a single founder using an AI-accelerated development process, with the test discipline and decision records to prove it — 180+ tracked items designed, built, tested, documented and closed, at a pace of multiple production-quality features per day. That is not a story about effort; it is a structural cost advantage. The same process now compounds: each new capability lands on tested foundations with its documentation and its tests in the same change.

The conversation

IsHaunted.com is deployed, differentiated, and priced on a principle that grows the community while charging for genuine value. The near-term roadmap — the engagement feed, payments, and the mobile app — is where investment converts directly into reach and revenue. I'd welcome the chance to walk through the product live; everything shown here is a login away.
